IMST-ART is an innovative, easy-to-use and high-performance engineering design tool for simulation of vapour-compression refrigeration systems. What it can do: IMST-ART can simulate the operation of a vapour-compression refrigeration system, including the main components such as compressors, valves, condenser, evaporator and heat exchangers, as well as the refrigerant cycle, including line pressure, temperatures and flows. As a result, users can perform preliminary design, simulation and troubleshooting, analyse efficiency and

energy requirements, as well as evaluate systems performance to identify the most suitable options, including model selection, auxiliary systems (such as chillers and fans), the installation location and the cost of manufacturing the equipment. Design from the start: IMST-ART not only can model a system with any refrigerants but also enables a user to define a process as a function of the operating conditions (temperature and pressure). This makes it possible to simulate a refrigeration system for any refrigerant, under any operating condition, without having to start with the full range of data. Advanced simulation technology: IMST-ART is an advanced simulation system that

integrates the state of the art simulation algorithms and high performance devices to accurately simulate the operation of any vapour-compression refrigeration systems. Modeling the refrigeration cycle: IMST-ART can simulate the operation of a refrigeration cycle in an extremely wide range of configurations, including evaporator/condenser, evaporator/condenser with expansion valve, evaporator/condenser with expansion valve and expansion valve, condenser/capillary tube, condenser/capillary tube with expansion valve, condenser/capillary tube with expansion valve and capillary tube, and condenser/capillary tube with capillary tube.

Constant performance through the entire system: IMST-ART is able to maintain a constant performance (capacity or efficiency) across the whole system. Model selection: IMST-ART allows a user to model any refrigeration system operating with almost any refrigerant. The user has access to a wide range of refrigerants, including the standard ones (Freon, HFC, HCFC) and the new ones (hydrogen, propane, ammonia, carbon dioxide). Evaluate performance under any operating conditions: IMST-ART can be used to evaluate the performance of a refrigeration

A powerful multi-terminal macro allowing you to use basic input operators (numeric,...) with intermediate data (logical and physical) in the computational fluid dynamics (CFD) environment. The following key features are offered by KEYMACRO: - Input/output of structures/structural part for finite element analysis (FEA) solvers (FEMAP and FEMGEN are included with Nastran) - Vapour flow models (CFD) for analytical flow calculations - Macromodel and... This software provides thermal performance analysis and simulations of the building, room, and whole building. It can provide the appropriate evaluation and decision making

of the environmental issues. The software is also based on the CHP facility and GIS environment. The software includes five modules: Building module - Building analysis for the building - The simulation of the thermal performance for all building - The evaluation of the thermal issues of the building - The assessment of the optimal design - The analysis of the energy consumption Room module - Room analysis for the building - The simulation of the thermal performance for each room - The evaluation of the thermal issues of the room - The assessment of the optimal design The whole building module - Whole building analysis for the building - The simulation of

the thermal performance for the whole building - The evaluation of the thermal issues of the whole building - The assessment of the optimal design CHP module - CHP analysis for the building - The simulation of the thermal performance for the whole building - The evaluation of the thermal issues of the whole building - The assessment of the optimal design GIS module - Integration of the GIS and software - The GIS for each building and environment - The integration of the building information - The integration of the rooms information - The integration of the CHP facility and software Features: - The software can be used as a stand alone application or as an add on

module for many existing building and design software - The software can be used to analyze building, room and whole building simulation - The software can be used to evaluate the thermal issues of the building - The software can be used to evaluate the design of the whole building - The software can be used to analyze the energy consumption of the building - The software can be used to analyze the CHP facility - The software can be used to analyze the GIS facility - The software 77a5ca646e

IMST-ART is an advanced performance simulation, computer-aided engineering design system. Features: User-friendly interface with advanced tools Easy and effective modelling process Easy-to-use, graphic-based, high-level programming environment Many kinds of components Tables User-definable components Libraries Interfaces Technical parameters of components Every component has a specific purpose and will play a different role in the simulation, for example: - Maximal pressure, flow, etc. on each valve of a compressor -

Temp and compression parameters on each valve of a condenser - Fields of each cylinder of a compressor - Power consumption per valve of a compressor - Heat energy for each valve of a compressor Features: User-friendly interface with advanced tools Easy and effective modelling process Easy-to-use, graphic-based, high-level programming environment Many kinds of components Tables User-definable components Libraries Interfaces Technical parameters of components Every component has a specific purpose and will play a different role in the simulation, for example: - Maximal pressure, flow, etc. on each valve of a compressor - Temp and compression parameters on each

valve of a compressor HGV-EPSI is a
graphical interface for HGV engineering
software. Introduction: HGV-EPSI is an
extension of the TURNOVER software
package to the design of heavy goods
vehicles. The package can be used to create a
master vehicle design and to validate the
configuration of the vehicle subcomponents.
The HGV-EPSI graphic interface is based on
a user friendly VDO system with
sophisticated analysis capabilities, a
workbench for the definition of the vehicle
structure, accurate and robust algorithms for

the modelling of mechanical aspects of the vehicle, the creation and validation of the graphical model of the vehicle and more.

Functionality: The HGV-EPSI package allows users to easily create and model the structural and functional aspects of a vehicle. It allows users to define the structural and functional characteristics of the vehicle in graphical form, including the design of the front, rear, sides and undercarriage of the vehicle, for example. The structure can be defined with respect to either the centre of gravity or the centre of mass

What's New In?

The invention is a refrigeration system or refrigeration apparatus that utilizes the vapor compression cycle and that is generally referred to as a refrigeration system or apparatus. There are numerous examples of refrigeration systems. A typical refrigeration system includes a compressor, a condenser, an expansion valve, and an evaporator. Refrigerants are generally used in such systems. A typical refrigerant is ammonia. The ammonia enters the system at low pressure and is compressed to a high pressure. The ammonia is then condensed at the condenser, and is then further compressed at the compressor and re-heated at the

condenser. A refrigeration system may utilize one or more of the refrigerants commonly used in refrigeration systems, such as ammonia, carbon dioxide, ethane, propane, butane, isobutane, carbon dioxide, etc. For example, such systems may use two or more refrigerants, such as a gas like carbon dioxide in combination with an ammonia refrigerant. One particular example of a refrigeration system is a so-called CFC-based refrigeration system, where a volatile chlorofluorocarbon refrigerant, such as CFC-12, CFC-22, CFC-11, CFC-113, HCFC-22, HCFC-142b, HCFC-1234yf, etc. is used. Such systems are commonly used in mobile air/conditioning systems and air conditioning systems for

refrigerated trucks, refrigerated trailers and refrigerated containers. The compressor and the condenser in a refrigeration system are generally custom-designed components. However, the evaporator, which is a very simple and economical component, can be used with many different refrigerant systems. The invention is a component of a refrigeration system. The components of such a system are well known. A refrigeration system has a compressor, a condenser, an expansion valve, and an evaporator. Refrigerants are generally used in such systems. In general, the compressor is a device that receives the low-pressure gaseous refrigerant, compresses it, and discharges the

refrigerant under pressure. The pressurized gaseous refrigerant from the compressor is typically passed through the condenser, which is a heat exchanger that transfers the heat in the refrigerant to the outside medium, such as air or water. The high-pressure gaseous refrigerant is then passed through the expansion valve, which lowers the pressure of the refrigerant and thus lowers the refrigerant's temperature. The refrigerant from the expansion valve is then passed through the evaporator, which is a heat exchanger that transfers the heat in the refrigerant to the outside medium, such as air or water. The compressor usually has a plurality of cylinders and a corresponding

plurality of pistons, each coupled to a crankshaft. The compressor also has a drive unit that causes rotation of the cranks

System Requirements For IMST-ART:

Windows 7, 8, 8.1 or 10 Mac OS 10.7 and higher Processor: 1.8GHz Intel Core i5, 2.0GHz Intel Core i7 or higher Memory: 4GB of RAM Graphics: Intel HD Graphics 3000 or AMD HD 4000 Storage: 20GB available space
